# Airspace and Aviation Safety Enroute to and in Vicinity of Airports **Obstruction Survey and Mapping**

# Background

- **An Obstacle/Obstruction Identification Surface (OIS) defines SAFE altitudes for approaches/landings and departures.**
- **The Next Generation Air Transportation System (NextGen)**
- **Satellite based airport flight procedures (>40% airports)**
- **The FAA standards for identifying obstructions to navigable air space apply to:**  
hilly terrain, natural-growth objects (**tall trees**), existing and planned manmade objects  
(**tall buildings, cell and TV towers, water towers, power transmission towers, tall electric light poles, windmills**), and temporary construction-related objects, **cranes**.

# Objectives

- To present airport application of Airborne LIDAR based obstruction survey methods and their benefits
- To show 3D visualization of airport infrastructure using imagery data for asset management

# ACRP 03-01 Project

<http://144.171.11.40/cmsfeed/TRBNetProjectDisplay.asp?ProjectID=135>

## *Light Detection and Ranging (LIDAR) Deployment for Airport Obstructions Surveys*

Project Period: January 30, 2007 – December 31, 2009

TRB Project Manager: Dr. Andrew Lemer

TRB Oversight: ACRP03-01 Panel & FAA Reps

- **PI: Waheed Uddin**      [cvuddin@olemiss.edu](mailto:cvuddin@olemiss.edu)
    - **Professor of Civil Engineering, University of Mississippi**
  - **Co-PI: Christopher Parrish**    [Chris.Parrish@noaa.gov](mailto:Chris.Parrish@noaa.gov)
    - **Research Scientist, NOAA – National Geodetic Survey (NGS)**
  - **Other NGS Staff: Jason Woolard, Cartographer**
  - **Consultants: Frank Scarpace, Alan Vonderohe, Bill Gutelius, David Ward, Robert Hutchins**
- Subcontractors: IAVO Research and Scientific**  
**@drwaheeduddin**

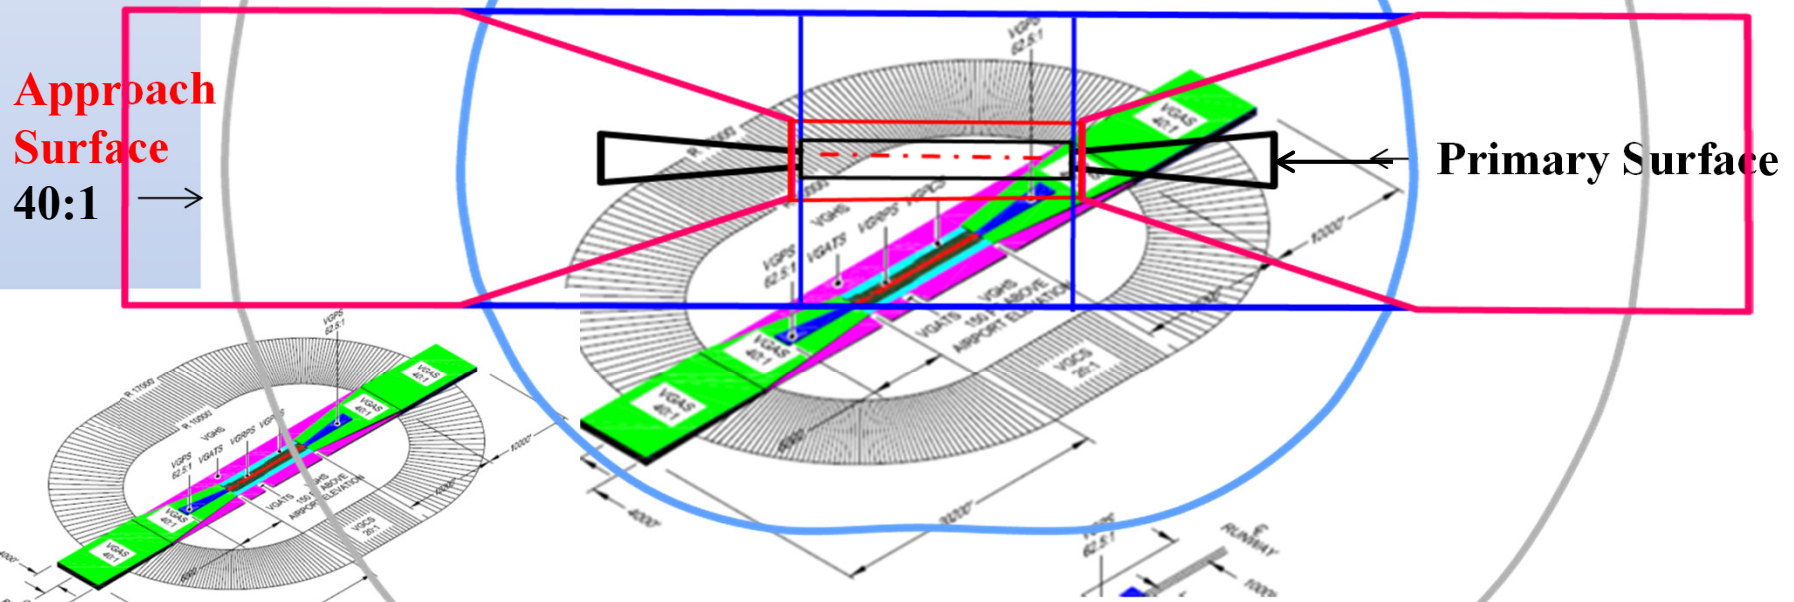

# OIS Surveys

- **Applicable survey standard documents - FAA**  
**AC 150/5300-16 A** “General Guidance and Specifications for Aeronautical Surveys: Establishment of **Geodetic Control** and Submission to the National Geodetic Survey”  
September 15, 2007  
**AC 150/5300-17 B** “: Standards for Using Remote Sensing Technologies in Airport Surveys” September 30, 2011  
Identifies the requirements for and how to collect the required imagery. **Allows LIDAR survey**  
**AC 150/5300-18 B** “General Guidance And Specifications for Submission of Aeronautical Surveys to NGS: Field Data Collection And Geographic Information System (GIS) Standards”  
May 21, 2009  
*Replaces Part-77 surfaces.*

# OIS Surveys

- **AC 150/5300-18B, Table 2.1** provides information on:  
Two types of “obstruction surveys”  
1) Vertically Guided    2) Non-Vertically Guided

**Vertically guided (VG)** instrument approaches such as ILS, PAR, MLS, LPV, TLS, RNP and Baro/VNAV

**Visual or Non-Vertically guided (NVG)**  
operations (Lateral Navigation (LNAV),  
Localizer Performance (LP), VOR, NDB,  
Localizer, Localizer Directional Aid (LDA), etc.)

# Remote Sensing Survey Technologies

The term LASER is an acronym for:

**L**ight  
**A**mplification by  
**S**timulated  
**E**mission of  
**R**adiation

The term LIDAR is an acronym of  
"**L**ight **D**etection **A**nd **R**anging."

**Traditional  
Aerial Photography/  
Photogrammetry**  
*Flying at high to low  
height above Ground*

*Low Flying at 730 m above  
ground for high resolution*

Remote Sensing and Geospatial Analysis for planning & Engineering Design

## Traditional Photogrammetry

@drwaheed

# Key Differences of LIDAR and Traditional Photogrammetry for Obstruction Surveys

<i>Key Parameters</i>	<b>Aerial Photography/ Photogrammetry</b>	<b>Airborne LIDAR</b>
<i>Operating Constraints</i>	No operations during <b>nighttime</b> , poor visibility	Operations <b>any time</b> during <b>day and night</b>
<i>Seasonal Restrictions</i>	Operational only during <b>leaf-on period</b> in wooded areas	Operational for more periods throughout year
<i>Environmental Effects</i>	Subject to flight rules of <b>visibility &amp; ceiling</b>	Subject to flight rules of <b>visibility &amp; ceiling</b>
<i>Terrain &amp; Built-up Area Constraints</i>	Can be <b>inaccurate</b> in extremely wooded areas, problem with shadow areas and sun angle	<b>More reliable</b> data for canopy and ground areas, problem with shadow areas

Reliable Hardware / Analysis Software: Available Commercially

# Key Differences Between LIDAR and Photogrammetry

- Traditional photography provides a **permanent photo** record of the terrain, which is a clear advantage.
- LIDAR **needs a recent georeferenced imagery** of the study area to identify the types of features and potential obstacles and verify the objects automatically extracted from computational analysis.
- LIDAR is **not constrained by operating limitations** of traditional photography method relative to nighttime and seasonal operating constraints.
- Photogrammetry is **more time consuming**; manual effort for stereoscopic post-processing; requires **seed** elevation.
- LIDAR is **computationally efficient**; less time consuming; and **easy to reanalyze** for different obstacle free imaginary surfaces.

# LIDAR Points Density vs. Flying Altitude for the Assumed Sensor Data

A nadir-looking LIDAR setting of 33 kHz PRF; 125 knots aircraft speed; a 7° or 20° scan angle

# LIDAR-derived digital surface model

## Stafford Regional Airport (NGS Project)

## ACRP 03-01 Project Info

<http://144.171.11.40/cmsfeed/TRBNetProjectDisplay.asp?ProjectID=135>

# Research Results Digest 10

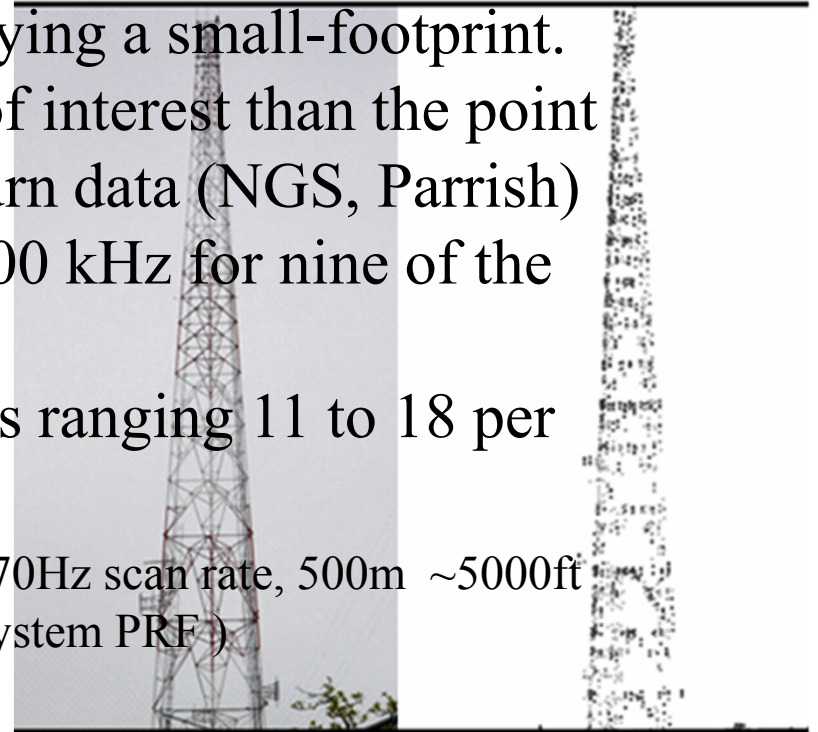

# Advances In LIDAR Technology for Airport Surveying

- Full-waveform LIDAR systems employing a small-footprint.
- 252% more points on vertical objects of interest than the point clouds generated from the discrete-return data (NGS, Parrish)
- Maximum PRF of above 150 kHz to 500 kHz for nine of the reviewed above 70 kHz PRF systems.
- Maximum point density in a single pass ranging 11 to 18 per sq m.

(Assuming 75 m/s aircraft speed,  $\pm 20^\circ$  scan angle, 70Hz scan rate, 500m ~5000ft flying height above ground level, and maximum system PRF )

- For 100 kHz or higher PRF with appropriate flight mission parameters and overlapping flightlines it is possible to achieve denser point spacing up to 30 points per sq m.

Intensity Data**

**Obstruction and Terrain Mapping,  
CAD, Geospatial software**

**(fusion with imagery)**

**Airport Obstruction Chart, Airport Layout Plan, *eALP*,  
Airport GIS, Engineering Analysis, and  
Asset Management Applications**

# 3D Feature Extraction For Airport Infrastructure Assets

- Airport assets can be visualized in a **GIS map** as planimetric features using georeferenced aerial imagery and orthophoto for producing eALP.
- The planimetric can be further used to create **built and non-built surface map** to estimate heat-island effects and sustainability dimensions.
- Geospatial mapping of **3D features** can enhance asset inventory.
